

GPS test week, 14-20 September 2026

Which app: run **both** GPS Custom and GPS Transistor in every session, started together. They are the two contenders for the recorder in the real app, and running them in the same pocket on the same round is what makes the comparison fair. Neither one logs your round, so keep using golf-tracker for that as usual.

- **GPS Custom** (teal icon): the GPS recorder written for this project.
- **GPS Transistor** (orange icon): Transistor Software's GPS library.

They were Bake-off K and Bake-off T until your pick on 2026-09-14, "GPS Custom / GPS Transistor". The phone shows the new names once I reinstall both apps at your next plug-in.

The week

Updated 2026-09-14, after the first round.

When	What	Your part
Mon 14 Sep, done	Walking 9 at Veenker (holes 10-18) with both apps. Both passed, with no gap over 20 s in 2 hours (n = 1 round). The screen was on 95% of the time, so the locked-screen part of your bar is still untested	Done
Mon 14 Sep, night	Fable reviews both apps on that round (item 2.3), then tests golf-tracker v24 (item 2.2). Fable's usage here is capped at 10% a week, so I ask you before each run	Type xhigh in the chat for 2.3. Answer yes or not yet before each run
This week, weather permitting	Your words: "another walking 9 or 2 is possible and this weekend all weather dependent". Both apps recording, golf-tracker as usual	Play
A locked-screen carry	Still owed. Fable's 2.3 answers what a fair locked-screen test needs, and the plan comes from that	Carry the phone, once it is planned

Your pick was that Fable reviews the apps before they go on the course ("Opus builds, Fable reviews"). Tonight's 2.3 is that review. Your phone's golf-tracker stays on v23 until Fable has tested v24 and you tell me to push it.

Every session: the same steps, in this order

Before. On your phone:

1. Charge it to 100%.
2. Settings → Security and privacy → **Auto Blocker** → **Off**.
3. Unlock it, plug it into the desktop, and tell me **"start"**.

I start both apps and check that both are recording, then I tell you **"unplug"**.

On your phone:

4. Unplug it. Settings → Security and privacy → **Auto Blocker** → **On**. Lock it and pocket it.

During. Use the phone normally: music, texts, golf-tracker. Do not open either test app.

After. On your phone:

5. Settings → Security and privacy → **Auto Blocker** → **Off**. Unlock it, plug it in, and tell me **"stop"**.

I stop both apps, pull the data, score it, and send you the result.

On your phone:

6. Settings → Security and privacy → **Auto Blocker** → **On**. I will prompt you.

If you cannot get to the desktop before a session, on your phone: open GPS Custom and tap **START**, then open GPS Transistor and tap **START**. At the end, in each app, press and hold **HOLD TO STOP**, then tap **EXPORT ALL TO DOWNLOADS**. The next time you are at the desktop, do step 5 and tell me **"pull"** instead of "stop".

What I send you after each session

For each app, PASS or FAIL against your bar: no gap over 20 s from START to STOP. With it:

- the longest gap and the number of fixes
- what the phone's own logs show around each gap: the app not running, or the app running with no GPS fixes
- the phone's battery from START to STOP. That is the whole phone together, not one app's share. The first number, from 2026-09-14: 90% → 78% over 2 hours (n = 1 round).

Picking the winner

After this week's sessions, an app that passes every session is the candidate for the real app. If both pass everything, or both fail, the choice is yours, with Fable's verdict and the numbers side by side.
