

Bake-off field data: Veenker, walking round, 2026-09-14

His words: "put all this data in a spot for Fable to pick it up in a new chat under your guidance. Commit and push it once processed".

On the push, he was told that pushing main would put golf-tracker v24 on his phone before Fable's test, and he picked **"Push to a branch (Recommended)"**. This folder is on branch bakeoff-data-2026-09-14. main is not pushed, and his phone stays on golf-tracker v23.

What is here

File	What it is
golf-bakeoff/K/20260914-160716-K/	The Bake-off K session: fixes.csv, events.csv, meta.json, summary.txt
golf-bakeoff/T/20260914-160724-T/	The Bake-off T session: same four files
golf-bakeoff/T/sdk-store-20260914-180811.json	T's own SQLite store, exported at 18:08:11
golf-tracker-20260914-1807.json	golf-tracker's export from the same phone at 18:07. It is the app's whole store; today's round is r_18b4b0bb
score-bakeoff.txt	tools/track-coverage.py run on golf-bakeoff/
score-golf-tracker-export.txt	tools/track-coverage.py run on the golf-tracker export (every track in it)
web-gaps-vs-native.txt	Output of compare-web-gaps.py (next row)
compare-web-gaps.py	Lists each golf-tracker gap on today's round, with the K and T fixes and phone events in the same window
scorecard-2026-09-14.jpg	His paper scorecard, sent in chat on 2026-09-14. Holes 10-18: 5, 3, 5, 3, 5, 4, 4, 5, 5 = 39 (par 36). Strokes only; no putts or penalties are written on it

Provenance.

- **Phone:** his Galaxy S26 (SM-S942U, Android 16, ro.build.version.oneui=80500).
- **Apps:** built from commit 44531f3, installed by bakeoff.ps1 setup on 2026-09-13. App code has not changed since.
- **The round:** he started both apps by hand at 16:07, stopped and exported both by hand at 18:07-18:08 (docs/bakeoff-field-card.md), and played it in golf-tracker v23 on the same phone.
- **The copy:** the files were copied byte for byte from the phone's Download folder with adb pull, on his "Yes, copy them".
- **One oddity:** K's exported files are timestamped 20:03 on the phone, but their contents end at K's STOP (18:07:54). Asked whether he exported K again around then, he answered "3 but 1 probably based off that time stamp" (3 was "Don't remember", 1 was "Yes"). A second export is likely; it is not confirmed.
- **Git:** the golf-tracker export is force-added by name, because .gitignore still carries the old golf-tracker-*.json guard. His words above are the say-so to commit it.

Results, measured: n = 1 round, 1 phone, 2 hours

Recorder	Window	Fixes	Covered	Gaps > 20 s	Longest gap	Median accuracy	Bar
Bake-off K	START 16:07:16 → STOP 18:07:54 (120.6 min)	7,237	120.6 min (100.0%)	0	2 s	3.1 m	PASS
Bake-off T, app log	START 16:07:24 → STOP 18:08:09 (120.8 min)	7,256	120.7 min (100.0%)	0	2 s	3.1 m	PASS
Bake-off T, SDK store	same window	7,249	120.7 min (100.0%)	0	2 s	3.1 m	PASS
golf-tracker (web app in Chrome, not a contender)	its track, 16:08:04 → 18:07:29 (119.4 min)	8,579	106.4 min (89.1%)	5	384 s	3.0 m	-

The bar is his pick: "99% coverage, no gap > 20 s", with START and STOP counting as the ends of a bake-off session (see android/bakeoff/README.md). golf-tracker is scored first fix to last, as in the handoff's Section 9 table.

golf-tracker's five gaps, against the native recorders

golf-tracker gap	Length	K fixes inside	T fixes inside	Phone events within 60 s (K's log)
16:58:27 → 17:02:23	236 s	235	235	none
17:09:51 → 17:10:12	21 s	21	21	none
17:21:18 → 17:22:35	77 s	76	76	none
17:41:17 → 17:47:41	384 s	383	383	screen_off 17:41:18, screen_on 17:47:34
17:49:31 → 17:50:35	64 s	64	64	none

Both native recorders kept one fix a second through every gap golf-tracker had. The longest gap lines up with the screen being off, from 17:41:18 to 17:47:34. The other four have no screen event near them, so these logs do not show what stopped golf-tracker's fixes.

Conditions, from the heartbeats (every 5 s)

- **Screen:** on at 1,369 of K's 1,445 beats (95%). T's log shows 1,371 of 1,447.
- **Doze, battery saver, charging, music:** music was playing at 0 beats. Doze, battery saver and charging were all off at every beat.
- **Standby, heat, battery setting:** standby bucket 5, thermal status 0, and Unrestricted, at every beat.
- **Recorder not running:** 1 beat in each app. Neither log has a gap in its fixes.
- **Phone battery:** 90% → 78% over 2.0 h. That is the whole phone (both Bake-off apps, golf-tracker, and anything else), not one app's share.
- **T's repeated fix times:** 10 in its log and 4 in its store, with no kill this time. K had 0.
- **K's availability event:** available=false, then true, both at START (16:07:16).

What this round did and did not test

It tested 2 hours of a real walking round, with both recorders running beside golf-tracker on the same phone: no gaps in either.

It did not test:

- **The locked-screen condition of the bar.** The screen was on 95% of the time; the only screen-off stretch was 6 minutes.
- **Music.** None was playing.
- **A process kill, or Samsung app sleeping.**

It is also **one round**.

His answers, 2026-09-14 (the next chat)

Question	His answer, verbatim
Marking	"I marked the first few holes and then quit marking to test the tracker on all apps. I think I marked the cup on every hole and the scorecard I provided is correct"
The phone during play	"pocket and push cart - always near the ball. This is the best data yet"
Did a test app's notification ever disappear?	"3 but did not mess with anything and they were still there at the end so leaning toward 1 as the answer" (3 was "Didn't check", 1 was "No, both stayed")
Problems	Picked "Nothing went wrong"
Penalties	Picked "No penalties"
Hole 11	Picked "Only 1 putt", which read: "Tee shot, chip from the rough, one putt. The second putt record is the extra one."
Hole 12	Picked "Ball on the green", which read: "It marked where the ball lay for putt 1 and got saved as a full shot. Tee, second shot, chip, 2 putts."

His scorecard against golf-tracker's records

Round r_18b4b0bb. golf-tracker counts a hole's strokes as its shot records plus penalty strokes (holeStrokes, js/round/round.js:580-584), and a putt is a shot record with lie green. The export file is unchanged: the corrections below are his answers, written down here, not edits to the data.

Measured: every one of the 9 holes has a cup mark (burst, quality good, accuracy 1.8-2.27 m). No hole has a penalty.

Hole	Par	Card	Records	Putts	Full shots	Marked by hand	Tee from track	Why the records differ
10	5	5	5	2	3	3	-	they match
11	3	3	4	1 (2 entered)	2	2	-	his answer: one putt
12	4	5	6	2	3	3	-	his answer: the 4th mark was putt 1's ball
13	3	3	2	2	1	0	-	1 full shot not marked
14	4	5	2	2	3	0	-	3 full shots not marked
15	4	4	2	2	2	0	-	2 full shots not marked
16	5	4	2	1	3	0	1	2 full shots not marked
17	3	5	3	2	3	0	1	2 full shots not marked
18	5	5	4	2	3	2	-	1 full shot not marked
Total	36	39	30	16	23	10	2	

- **Putts** are the counts he entered in golf-tracker, with hole 11 corrected by his answer. [measured, as entered]
- **Full shots** are the card minus putts, so they rest on those entries. [inferred]
- **Tee from track:** on holes 16 and 17 the tee shot was inserted from the track in the app, not marked on the tee.

Holes 11 and 12, measured (the distance from each mark to that hole's cup mark):

- **Hole 11:** tee 133.0 yd; rough 44.0 ft, 41 s before the cup mark; green 10.4 ft, 10 s before, with its putt typed as 1 ft; then a second putt record entered by hand at 16:33:03.
- **Hole 12:** tee 294.1 yd; rough 138.4 yd; rough 57.2 ft, 14 s before the cup mark; then a 4th mark 37.1 ft from the cup, 9 s after the cup mark, stored with lie: 'fairway', lieInferred: true. The putts (24 ft, 3 ft) were typed at 18:07:10, at the end of the round.

What hole 12 shows about golf-tracker v23, read from the code: setGreenEntry (js/round/round.js:513-527) keeps a marked shot as putt 1 only when its lie is green. Putt 1's ball mark had been stored with an inferred fairway lie, so it stayed a full shot and both typed putts were added as new records: 6 records for 5 strokes. It bears on the green flow planned for the native app (docs/HANDOFF-native-build.md, Section 7: mark cup, mark putt 1, score). Nothing is queued for it.

Shot detection, checked against his answers and the course map (2026-09-15)

He asked, 2026-09-15: "correct. Did you find all the shots on 13-17. That was my intent to test the tracker". His answers, verbatim, in order:

"15. 1st stop was the shot from 176 put to 5 yards. 2nd stop was we unloading everything at 16 tee and a short break 14. 2nd was 151 with a tree directly in front on me that I had to hook it around, 3rd from 29 that was my worse chip of the day, 17. yes was a shit show"

"15. was fairway, 14, rough, and 17 2 rough shots"

"i had to let someone play through on 12 tee so you should see a long break there"

"14 was a chip from the right side of the fairway - correct!"

On 17, his "yes" confirmed a tee shot from about 138 yd and shots from about 40 and 23 yd.

Reproduce: serve the repo (python tools/devserver.py 8123) and open /docs/bakeoff-data/2026-09-14-veenker-walking/detection-check.html. It runs the shipped js/round/track-analysis.js on golf-tracker's track and on GPS Custom's (Bake-off K on the day), against the answers above and docs/course-map/veenker/osm_full.json. It only reads. A pick counts as right within 10 m of

the shot's stand, the same match tools/detection-scoring.html uses against marks.

Results, n = 1 round:

	golf-tracker's track	GPS Custom's track
Holes 13-17: full shots with a stand of 20 s or more (n = 12)	9 (hole 17's three fall in its screen-off gap)	12
Picked right, with the window the app would have used on the course	6	5
Picked right, with the window from cup mark to cup mark	6	7
Holes 10-12 and 18: hand-marked full shots with a stop within 10 m (n = 10)	9	9
... and selected by the ranking	5	5

Of the 12 full shots on 13-17, 10 positions are known (a stand inside a mapped tee box, or his word) and 2 are inferred: hole 16's stands at 252 and 103 yd, the only long stands between its tee and green.

Why picks went wrong, each visible in the page:

- **The previous green.** He marks the cup, then putts, so the putting stand falls into the next hole's window. It was picked as a shot on 14, 16 and 17.
- **A long stand that is not a shot beats a real one on dwell.** The cart break at 16's tee (145 s) was picked on 15 with every track and window.
- **Walking with a push cart** breaks into 10-15 s stops; one was picked on 17.
- **Chips near the green are ranked down** while enough other stops remain: 17's shots from 40 and 23 yd.
- **A window that closes when he types the putts at the next tee** makes "the last stop is the green" point at that tee: on 13, GPS Custom's putting stand was picked as the tee shot.

The course map: all five tee stands on 13-17 and all four hand-marked tees (10, 11, 12, 18) are inside mapped tee boxes. The two tees the app inserted from its own track are not: 16's by 18.7 m (the cart spot) and 17's by 6.8 m (a walking pause). His five lies all match the map (n = 5); two sit within 4 m of a fairway edge (0.6 m and 3.0 m).

12's tee: one GPS Custom stand of 542 s (16:33:29-16:42:31) ends at the tee mark (16:42:34), centred 12.1 m from it and outside the tee box. The play-through wait and the tee shot are one stand, which is why 12's tee was the one hand mark with no stop within 10 m.

For Fable

This is field evidence for item 2.3 in docs/handoff/FOR_FABLE.md, reviewed at xhigh on his word. To reproduce it, from the repo root:

```
python tools/track-coverage.py docs/bakeoff-data/2026-09-14-veenker-walking/golf-bakeoff
python tools/track-coverage.py docs/bakeoff-data/2026-09-14-veenker-walking/golf-tracker-20260914-1807.json
python docs/bakeoff-data/2026-09-14-veenker-walking/compare-web-gaps.py
```

Item 2.3 carries the questions this round adds.

The tool changed after this folder was committed: the four small changes Fable recommended in docs/handoff/REPORT_2.3.md, made on his word "make the four changes, then run 2.2". Re-run, the first command now splits the repeated fix times: T's 10 in its log and 4 in its store are all the same fix handed over again, and none is a different fix at the same time. Every other line of score-bakeoff.txt is unchanged, and the second command's output is identical to score-golf-tracker-export.txt (both diffed 2026-09-14).
