

Next chat: start here (written 2026-09-14, after the first bake-off round)

Paste this to open the new chat:

Read docs/handoff/NEXT_CHAT_2026-09-14.md first, then docs/HANDOFF-native-build.md. I have answers for the blanks.

Fable's review of the apps (item 2.3) runs only after you type **xhigh** in that chat. Add it whenever you want it to run.

1. Where things stand

- **Your phone runs golf-tracker v23.** GitHub main is 0ba7721, and nothing was deployed today.
- **Local main is not pushed.** It carries build v24, the bake-off apps, their tools, today's data and your scorecard. v24 waits for Fable's test (item 2.2) and your word. Pushing main is the deploy.
- **Branch** bakeoff-data-2026-09-14 **is pushed**, with the commit that adds this file. It is a copy on GitHub and does not deploy.
- **On the phone:** both test apps are installed on the S26, both are stopped, and both have Unrestricted battery. Auto Blocker is **on** (confirmed 2026-09-14: adb no longer saw the phone). Today's exports are still in the phone's Download folder.

2. What these two chats built

What	Where
The two test recorders: Bake-off K (teal, the recorder written for this project) and Bake-off T (orange, Transistor Software's library)	android/bakeoff/
Desktop script that does all the phone work: devices, setup, samsung, start, status, stop, pull	android/bakeoff/bakeoff.ps1
Scoring tool: the Section 9 measure, with START/STOP edges, T's own store, repeated fix times and battery	tools/track-coverage.py
This week's test plan, and the card for reading on the course	docs/bakeoff-test-week.md , docs/bakeoff-field-card.md
Today's round data, scored, with your scorecard photo	docs/bakeoff-data/2026-09-14-veenker-walking/
Fable's queue, with item 2.3 updated for today's round	docs/handoff/FOR_FABLE.md
Every decision Opus made alone, and why	docs/DECISIONS_LOG.md (entries marked Opus)
PDF maker: python tools/md2pdf.py in.md out.pdf	tools/md2pdf.py

3. Your decisions, in your words

Decision	Your words or pick
Native shell before 2026-10-07	"Native shell (Recommended)"
Contenders	"Kotlin vs transistorsoft (Recommended)"
Who builds	"Opus builds, Fable reviews (Recommended)": Fable reviews at xhigh before the apps go on the course
Pass bar	"99% coverage, no gap > 20 s (Recommended)"
Installs	"You may install whatever is needed"
Phone work	"Code you are going to do all the work. I plug in my phone, enable USB debugging and turn off the blocker get that all ready"
Today's data	"put all this data in a spot for Fable to pick it up in a new chat under your guidance. Commit and push it once processed", then "Push to a branch (Recommended)"

4. Today's round, measured (n = 1 round)

Veenker Memorial, walking, gold tees, back nine (holes 10-18). golf-tracker ran from 16:08 to 18:07 CDT, with the two test apps running beside it on the same phone.

Recorder	Fixes	Gaps > 20 s	Longest gap	Median accuracy	Bar
Bake-off K	7,237	0	2 s	3.1 m	PASS
Bake-off T, app log	7,256	0	2 s	3.1 m	PASS
Bake-off T, its own store	7,249	0	2 s	3.1 m	PASS
golf-tracker's own track	8,579	5	384 s	3.0 m	-

- Both test apps kept one fix a second through all five of golf-tracker's gaps. The 384 s gap lines up with the screen being off, 17:41-17:47.
- The screen was on at 95% of heartbeats and no music was playing, so the bar's locked-screen condition is still untested.
- The phone's battery went 90% → 78% over 2.0 h, counting everything running on it.

Your scorecard, against golf-tracker's shot records (round r_18b4b0bb). The card is [scorecard-2026-09-14.jpg](#).

Hole	10	11	12	13	14	15	16	17	18	Total
Par	5	3	4	3	4	4	5	3	5	36
Your scorecard	5	3	5	3	5	4	4	5	5	39
golf-tracker shot records	5	4	6	2	2	2	2	3	4	30

Shot records are not strokes: putts, cups and undone marks may be stored differently. The next chat reads the round's schema before calling any hole right or wrong.

5. Blanks for you to fill in

1. **Scorecard: received** (above). Putts and penalties are not on the card. Add them if you remember them.
2. **Marking:** did you mark every shot in golf-tracker? Which holes did you log fully, and which only partly?
3. **The phone during play:** pocket, bag or hand? The screen was on 95% of the round.
4. **Test app notifications:** did either one ever disappear? If so, on which hole?
5. **Problems:** anything that went wrong on the course, in golf-tracker or the test apps?
6. **K's second export:** its files on the phone are timestamped 20:03. Did you export K again around then?
7. **v24:** push it to your phone after Fable's test (2.2)? Yes or no.
8. **App names:** what should the two test apps be called? Offered: GPS Custom / GPS Transistor.
9. **Rounds this week:** still on for Tuesday 15 Sep (walking 9) and 19-20 Sep?
10. **Fable's review of the apps:** type **xhigh** when you want item 2.3 to run.

Answered, 2026-09-14 (the next chat)

#	His answer, verbatim
1	"the scorecard I provided is correct". Penalties: picked "No penalties". The putt counts he entered in golf-tracker stand, with hole 11 corrected by row 2
2	"I marked the first few holes and then quit marking to test the tracker on all apps. I think I marked the cup on every hole and the scorecard I provided is correct". Hole 11: picked "Only 1 putt". Hole 12: picked "Ball on the green"
3	"pocket and push cart - always near the ball. This is the best data yet"
4	"3 but did not mess with anything and they were still there at the end so leaning toward 1 as the answer" (3 was "Didn't check", 1 was "No, both stayed")
5	Picked "Nothing went wrong"
6	"3 but 1 probably based off that time stamp" (3 was "Don't remember", 1 was "Yes")
7	"Yes but Fable is restricted 10% weekly usage on this project so plan accordingly and let me pick if a usage choice needs made"
8	Picked "GPS Custom / GPS Transistor"
9	"another walking 9 or 2 is possible and this weekend all weather dependent"
10	Not typed yet. Fable's order: picked "2.2 → 2.3 → 1.1 (Recommended)". Data for 2.3: picked "The round only (Recommended)"

The hole-by-hole check of his card against golf-tracker is in the round's [README](#), section "His scorecard against golf-tracker's records".

6. The next chat's work, in order

1. Read this file, then [docs/HANDOFF-native-build.md](#). Check `git log`, the branch, and that the tree is clean.
2. Take his answers to Section 5. Read how round `r_18b4b0bb` stores shots, putts and cups, then compare it hole by hole with his scorecard.
3. When he types **xhigh**, run Fable's queue in the order written at the top of [FOR_FABLE.md](#): 2.2 (test v24), then 2.3 (the test apps, with today's data), then 1.1 (the course map). Each is one spawn, run in the foreground, carrying the commit hash. Relay DONE or BLOCKED word for word.
4. Push `main` (the v24 deploy) only on his word, after 2.2.
5. Rename the test apps at the next plug-in: `rebuild`, then `bakeoff.ps1` setup to reinstall. Read the grants back after the reinstall.
6. The test week continues. A carry with the screen locked is still owed.

7. Gotchas already paid for

- **adb and Auto Blocker**: adb reaches the phone only with Auto Blocker off. When the phone work is done, prompt him to turn it on with one plain question.
- **Emulator**: an emulator from another session (`emulator-5554`) may be attached. Pass `-Serial RFGL4275NVH` to every `bakeoff.ps1` task.
- **Deletes**: the harness blocks PowerShell commands containing `rm -rf` or `Remove-Item`. Write to a new folder instead.
- **Samsung Settings** reopens on the last page it showed, so `bakeoff.ps1` force-stops Settings before walking it.
- **One UI 8.5**: Unrestricted battery and "Never auto sleeping apps" exclude each other (measured on his S26). Both apps are Unrestricted.
- **Round exports**: `golf-tracker-*.json` is gitignored. Force-add by name, and only on his word.
- **Git**: stage by name, never `git add -A`. Commits are `rusty9645@gmail.com`.
- **How he wants to work** (memory): phone work is Claude's; answer his question first, then the complete plan in one pass; confirm prompts are one state, one action, one yes or not-yet question; every document gets a PDF.
